

Lab 7.3.1.6 – Exploring DNS Traffic

This lab has been updated for use on NETLAB+. www.netdevgroup.com

Objectives

Part 1: Explore DNS Query Traffic

Part 2: Explore DNS Response Traffic

Background / Scenario

Wireshark is an open source packet capture and analysis tool. Wireshark gives a detailed breakdown of the network protocol stack. Wireshark allows you to filter traffic for network troubleshooting, investigate security issues, and analyze network protocols. Because Wireshark allows you to view the packet details, it can be used as a reconnaissance tool for an attacker.

In this lab, use Wireshark to filter for DNS packets and view the details of both DNS query and response packets.

Part 1: Explore DNS Query Traffic

- Access the **WinClient** machine. Unlock the machine by clicking on the drop-down arrow for that specific machine's tab and select **Send CTRL+ALT+DEL**.
- Login as the **cyberopsuser** using **cyberops** as the password.
- On the *Desktop*, navigate to the **Toolbox** folder and open the **dns_query_files** folder.
- Open the **dnsquery-cisco.txt** file.
- Notice the *DNS* query information from the www.cisco.com domain.

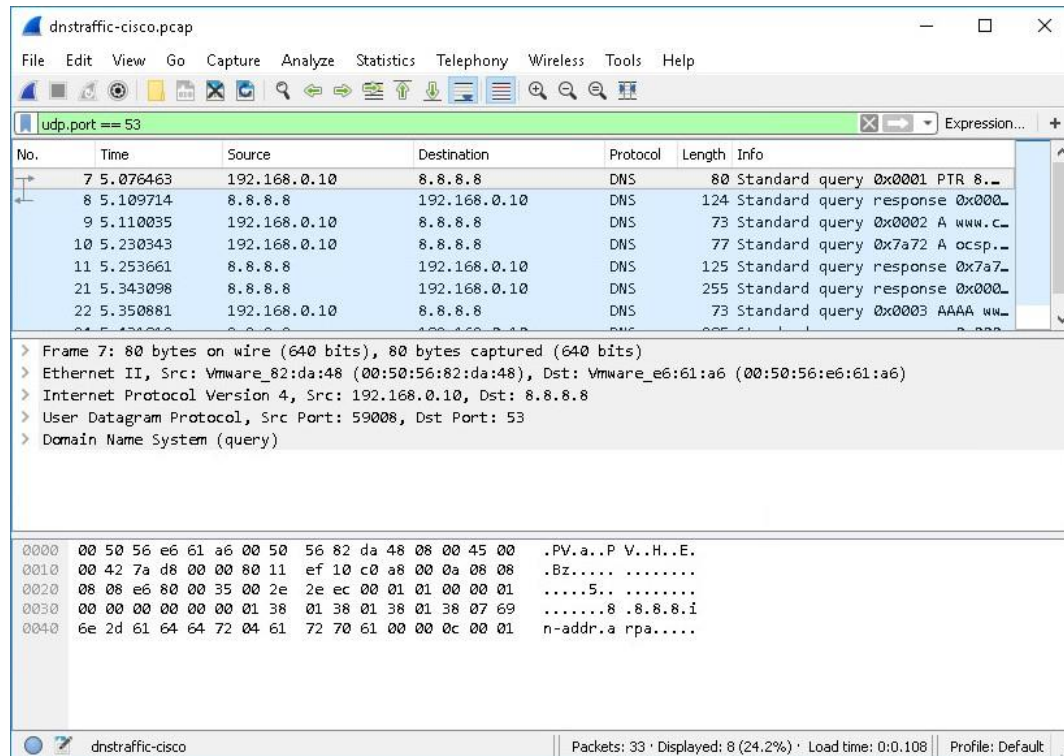

A screenshot of a Notepad window titled "dnsquery-cisco - Notepad". The window contains the following text:

```
Server: google-public-dns-a.google.com
Address: 8.8.8.8

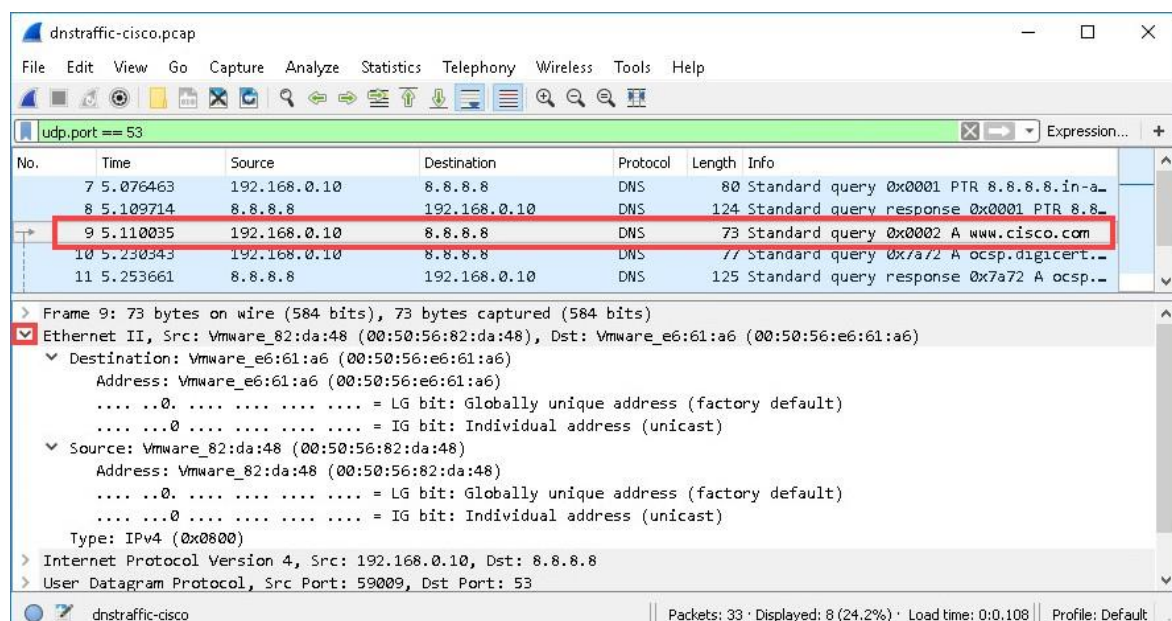

Name: e2867.dsca.akamaiedge.net
Addresses: 2600:1407:a000:196::b33
           2600:1407:a000:1b7::b33
           104.67.74.130
Aliases: www.cisco.com
         www.cisco.com.akadns.net
         www.cisco.com.edgekey.net
         www.cisco.com.edgekey.net.globalredir.akadns.net
```

Lab - Exploring DNS Traffic

- Minimize the **Notepad** application and change focus to the **Toolbox** folder.
- Launch the **Wireshark** application. Navigate to **File > Open** and choose to open the **dnstraffic-cisco.pcap** file from the **pcaps** folder in the *Toolbox* folder.
- Observe the traffic captured in the *Wireshark Packet List* pane. Enter **udp.port == 53** in the filter box and click the arrow (or press enter) to display only DNS packets.

- Select the DNS packet labeled **Standard query 0x0002 A www.cisco.com**.
- In the *Packet Details* pane, notice this packet has *Ethernet II*, *Internet Protocol Version 4*, *User Datagram Protocol* and *Domain Name System (query)*.
- Expand **Ethernet II** to view the details. Observe the source and destination fields.

Lab - Exploring DNS Traffic

What are the source and destination MAC addresses? Which network interfaces are these MAC addresses associated with?

The Source MAC address is 192.168.0.10. It is associated with NIC and Destination MAC address is 8.8.8.8. It is associated with default gateway. This is associated DNS protocol.

- I. Expand **Internet Protocol Version 4**. Observe the source and destination IPv4 addresses.

The screenshot shows the dnstraffic-cisco.pcap application. The top menu bar includes File, Edit, View, Go, Capture, Analyze, Statistics, Telephony, Wireless, Tools, and Help. Below the menu is a toolbar with various icons. A filter bar at the top shows 'udp.port == 53'. The main window displays a list of network packets with columns: No., Time, Source, Destination, Protocol, Length, and Info. The selected packet (No. 9) is a DNS Standard query from 192.168.0.10 to 8.8.8.8. Below the packet list, the details pane shows the expanded 'Internet Protocol Version 4' section, displaying fields such as Version: 4, Header Length: 20 bytes (5), Total Length: 59, Identification: 0x7ad9 (31449), Flags: 0x00, Fragment offset: 0, Time to live: 128, Protocol: UDP (17), Header checksum: 0xef16 [validation disabled], Source: 192.168.0.10, and Destination: 8.8.8.8. The bottom status bar indicates 33 packets, 8 displayed (24.2%), and a load time of 0:0.108.

No.	Time	Source	Destination	Protocol	Length	Info
7	5.076463	192.168.0.10	8.8.8.8	DNS	80	Standard query 0x0001 PTR 8.8.8.8.in-a-
8	5.109714	8.8.8.8	192.168.0.10	DNS	124	Standard query response 0x0001 PTR 8.8.8.8
9	5.110035	192.168.0.10	8.8.8.8	DNS	73	Standard query 0x0002 A www.cisco.com
10	5.230343	192.168.0.10	8.8.8.8	DNS	77	Standard query 0x7a72 A ocsp.digicert.
11	5.253661	8.8.8.8	192.168.0.10	DNS	125	Standard query response 0x7a72 A ocsp.
21	5.343098	8.8.8.8	192.168.0.10	DNS	255	Standard query response 0x0002 A www.c-
22	5.350881	192.168.0.10	8.8.8.8	DNS	73	Standard query 0x0003 AAAA www.cisco.c-
24	5.421012	8.8.8.8	192.168.0.10	DNS	105	Standard query response 0x0003 AAAA ww

Internet Protocol Version 4, Src: 192.168.0.10, Dst: 8.8.8.8

- 0100 = Version: 4
- 0101 = Header Length: 20 bytes (5)
- > Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)
- Total Length: 59
- Identification: 0x7ad9 (31449)
- > Flags: 0x00

dnstraffic-cisco | Packets: 33 · Displayed: 8 (24.2%) · Load time: 0:0.108 | Profile: Default

What are the source and destination IP addresses? Which network interfaces are these IP addresses associated with?

The Source IP address is 192.168.0.10. It is associated with NIC and Destination IP address is 8.8.8.8. It is associated with default gateway. This is associated with DNS network.

Lab - Exploring DNS Traffic

- m. Expand the **User Datagram Protocol**. Observe the source and destination ports.

What are the source and destination ports? What is the default DNS port number?

The source port number is 59009 then the destination port number is 53 and it is associated with the default DNS protocol.

- n. Open a **Command Prompt** and enter `arp -a` and `ipconfig /all` to record the MAC and IP addresses of the PC.

```
C:\Windows\system32>arp -a

Interface: 192.168.0.10 --- 0x8
    Internet Address      Physical Address         Type
    192.168.0.1           08-00-27-8c-29-85       dynamic
    192.168.0.255         ff-ff-ff-ff-ff-ff       static
    224.0.0.22            01-00-5e-00-00-16       static

Compare the MAC and IP addresses in the Wireshark results to the results from the **ipconfig /all** results. What is your observation?

The MAC and IP address in the Wireshark results are same as the address from the above ipconfig/all command.

- o. Change focus to the **Wireshark** application and expand **Domain Name System (query)** in the *Packet Details* pane followed by expanding **Flags** and **Queries**.

Lab - Exploring DNS Traffic

- p. Observe the results. The flag is set to do the query recursively. The query is requesting the IP address to *www.cisco.com*.

Queries

- www.cisco.com: type A, class IN
 - Name: www.cisco.com
 - [Name Length: 13]
 - [Label Count: 3]
 - Type: A (Host Address) (1)
 - Class: IN (0x0001)

Frame (frame), 73 bytes | Packets: 33 · Displayed: 8 (24.2%) · Load time: 0:0.108 | Profile: Default

Part 2: Explore DNS Response Traffic

- a. Select the corresponding response DNS packet labeled **Standard query response 0x0002 A www.cisco.com**.

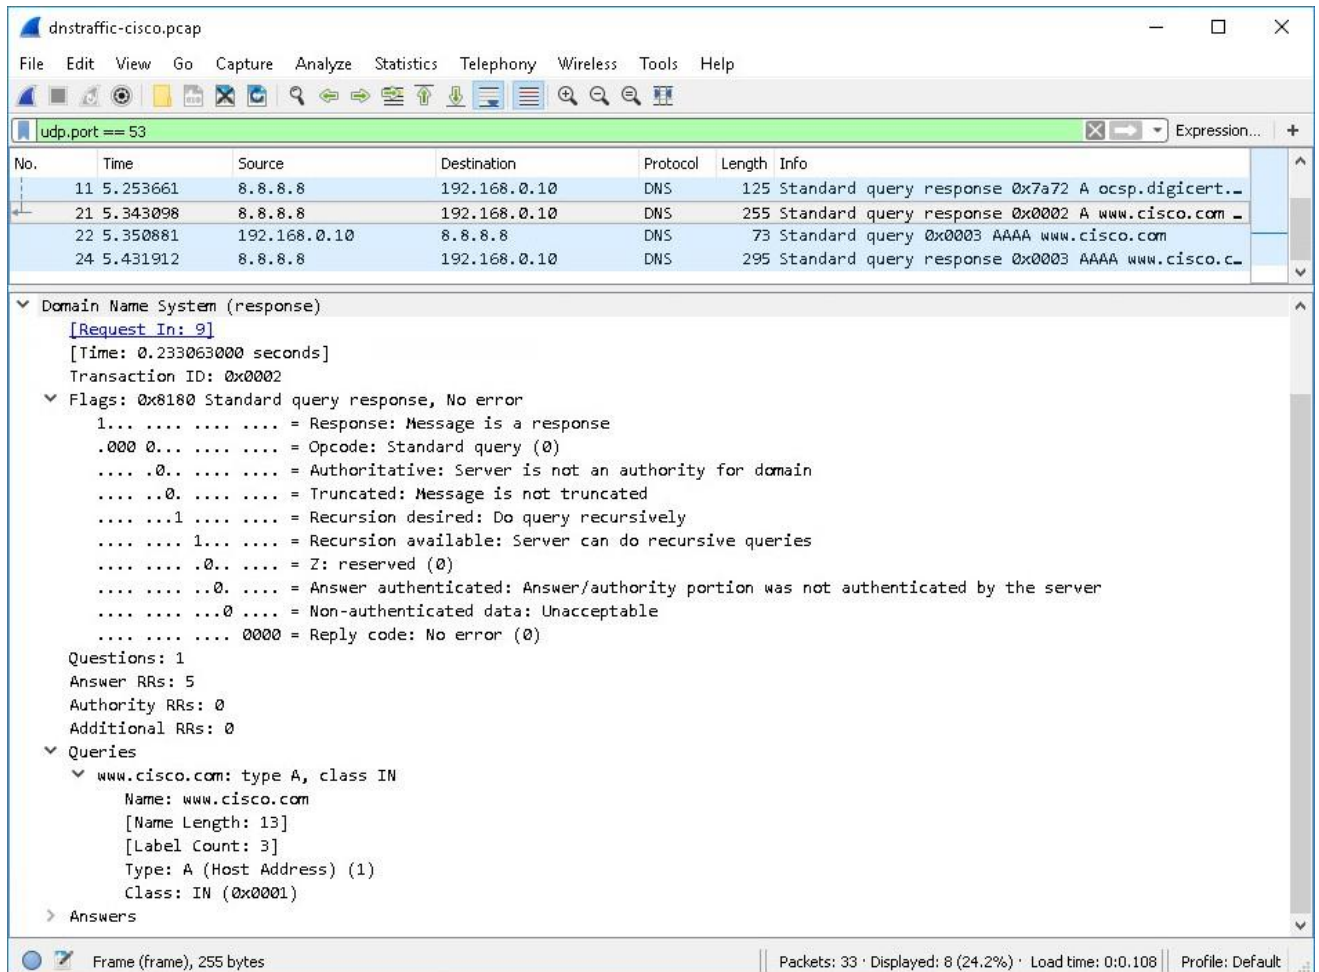

What are the source and destination MAC and IP addresses and port numbers? How do they compare to the addresses in the DNS query packets?

The Source MAC address, IP address and port number in the query packets are known as Destination address. Destination MAC address, IP address and port number in the query packets are called as Source address.

- b. Expand **Domain Name System (response)**. Then expand the **Flags**, **Queries**, and **Answers** entries.

- c. Observe the results. Can the DNS server do recursive queries? YES

- d. Observe the CNAME and A records in the Answers details. How do the results compare to nslookup results?

The result in nslookup is same as Wireshark in records.

Reflection

1. From the Wireshark results, what else can you learn about the network when you remove the filter?

When you remove the filter in Wireshark, you can learn a lot more about the network traffic such as security risks, bandwidth usage and network protocols.

2. How can an attacker use Wireshark to compromise your network security?

Wireshark is a network analysis mechanism that can be used to capture and inspect network traffic in real-time. Such as to gain sensitive information such as login credentials, credit card numbers and confidential data.
